Backgrounds & Motivation

- Financial fraud is a serious commercial problem worldwide.
- Existing analytical procedures for corporate fraud investigation highly rely on financial statements.
- However, data in a financial statement are often not appropriate to detect fraud in a timely manner and may contain misleading and fictitious information.
- In recent years, financial social media platforms for investment research have burgeoned. And the opinions and views expressed have been shown to contain value-relevant information and have been used to predict future stock returns.
- ➤ Can the user-generated content (UGC) on financial social media platforms be useful in assessing the potential risk of corporate fraud?

Literature Review

 Data Source- tap into only traditional data sources such as financial statements MD&A and earnings conference calls

 use the MD&A and calls usually well-planned and prepared in advance

Table 1. Representative Studies of Corporate Fraud Detection and Data Sources

| Data type | Indicators | Literature | Data source | |
|-------------------|---------------------------------|---|---|--|
| Structured data | Numerical financial variables | Cecchini et al. [15] | Financial statements | |
| | Financial ratios | Summers and Sweeney [64]; Dechow et al. [19]; Abbasi et al. [1] | Financial statements | |
| | Nonfinancial variables | Brazel et al. [10] | Financial statements | |
| Unstructured data | Features from language-based | Larcker and Zakolyukina [36] | Earnings conference calls | |
| | textual content | Purda and Skillicorn [55] | MD&A section from financial statements | |
| | Features from vocal speech | Hobson et al. [30] | Earnings conference calls | |
| | Social media features | Current study | Financial social media platform, for example, | |
| | | | SeekingAlpha | |

Table 2. Text-based Methods of Corporate Fraud Detection

| Technique | Literature | Source of text | |
|-------------------------|--|---|--|
| Dictionary-based method | Purda and Skillicorn [55] | MD&A section from both annual and quarterly reports | |
| | Larcker and Zakolyukina [36] | Earnings conference calls | |
| | Humpherys et al. [31] | MD&A section of the 10-K report | |
| Statistical method | Cecchini et al. [16]; Glancy and Yadav [26]; Moffitt et al. [47] | MD&A section of the 10-K report | |
| | Goel and Gangolly [27]; Goel et al. [28] | The entire text of the 10-K report | |

Research Problem

- Is the user-generated content (UGC) on financial social media platforms useful in assessing the potential risk of corporate fraud?
- Is there any incremental value?
- ➤ Based on systemic functional linguistics (SFL) theory, we extracts signals such as sentiment features, emotion features, topic features, lexical features, and social network features, which are then fed into ML classifiers and can detect fraud well.
- > The incremental value really exists.
- Will our model be influenced by rumors in social media?
- ➤ No.

Contribution

- This is one of the first studies to use textual data from social media platforms for corporate fraud detection.
- Use an Systemic Functional Linguistics / SFL-Based Framework for UGC from social media platforms.

- Systemic Functional Linguistics (SFL)
- > Systemic
- > Functional: ideational, interpersonal, and textual

概念功能:语言是用来组织、理解和表达我们对世界的看法和我们自己的思想和意识的。

人际功能:语言作为交流的媒介,是创造和维持人际关系的手段。

语篇功能:决定了信息的组织和呈现方式,使得一堆随机排列的句子组成实际的、具有意义的文本。

- 1. Ideational Function: topics, opinions, and emotions
- Topics

Method: LDA

Opinions and emotions

Method: We use the emotional categories defined in the Linguistic Inquiry and Word Count dictionary to measure sentiment polarity, "assent," "anxiety," "anger," "swear," and "sadness" emotions.

 cognitive appraisal: How an individual views a firm's operations condition.

Method: Three separate word lists are developed to capture 3 part of cognitive appraisal: (1) overall description of the fraudulent situation; (2) detailed analysis of the fraudulent behavior; and (3) legal judgments and sanctions.

1. Ideational Function: Measures of Opinions and Emotion Features

| Type | Feature | Measurement |
|----------|--------------------------------|--|
| Opinions | Ratio of positive sentiment | Total number of positive words divided by total number of words* |
| | Ratio of negative sentiment | Total number of negative words divided by total number of words |
| Emotions | Ratio of assent words | Total number of assent words divided by total number of words |
| | Ratio of anxiety words | Total number of anxiety words divided by total number of words |
| | Ratio of anger words | Total number of anger words divided by total number of words |
| | Ratio of swear words | Total number of swear words divided by total number of words |
| | Ratio of sadness words | Total number of sadness words divided by total number of words |
| | Ratio of fraud synonyms words | Total number of synonyms of fraud divided by total number of words |
| | Ratio of fraud analysis words | Total number of fraud analysis words divided by total number of words |
| | Ratio of legal judgments words | Total number of legal judgments words divided by total number of words |

2021/10/8

2. Textual Function

three information types - writing styles, genres, and vernaculars
 Genres in a document represent how writers typically use language to respond to recurring situations.

Merkl-Davies and Brennan found that corporate narratives can be regarded as an identifiable genre for business communication with distinctive linguistic properties.

Method: TF-IDF

3. Interpersonal Function

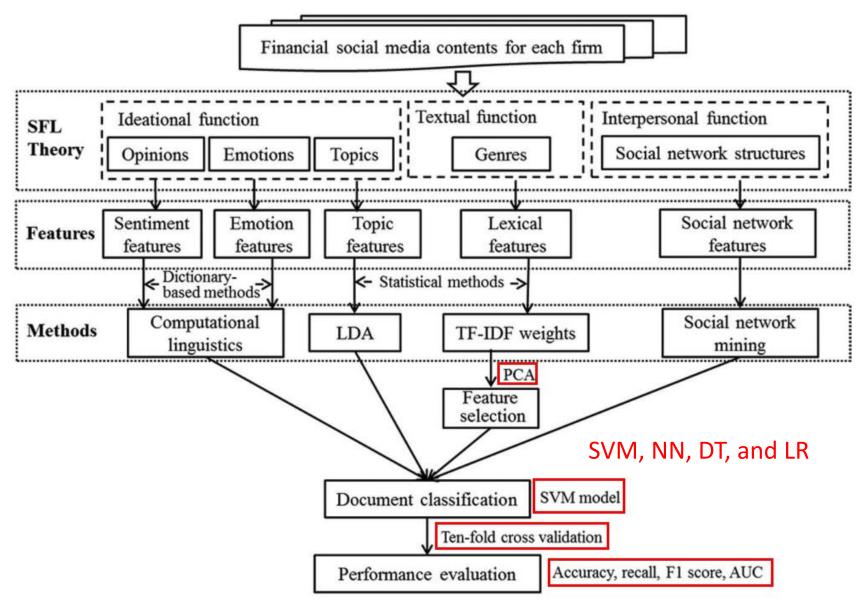

It is generally represented by social structure that can be built through the reply-to relationships between messages.

Social structural characteristics can be used to delineate deception in computer mediated communication.

Method:

| Туре | Feature and measurement | No. of features |
|------------------------------|---|-----------------|
| Social interaction structure | Number of Analysis reports (AR), Breaking news (BN), or StockTalk messages (SM) | 3 |
| | Number of comments to AR, BN, or SM | 3 |
| | Numbers of distinctive authors for AR, or SM | 2 |
| | Numbers of AR or SM per author | 2 |
| | Number of followers | 1 |

An SFL-Based Framework

Data

- Financial social media data source: SeekingAlpha
- > insights are provided by investors and industry experts from the buyside rather than the sell-side
- ➤ For each firm, there are five types of topic discussions: Analysis reports, Breaking news, Earning call transcripts, StockTalk, and Videos.
- Financial ratios and the textual contents of the MD&A section from the annual financial statements are from the Compustat and the EDGAR database.
- ➤ Financial ratios: 12 annual financial ratios, 24 industry-collaboration contextual features, 24 industry-competition contextual features, and 24 organization contextual features

Sample Selection

| Distinct companies | | | | |
|--|-----|--|--|--|
| Companies with accounting misconducts in Dechow et al. [19] data set | | | | |
| Less: companies with only quarterly fraudulent events | 132 | | | |
| Subtotal (companies with annual fraudulent events) | 804 | | | |
| Less: companies with auditor, bribes, disclosure, no dates, and other issues | 38 | | | |
| Subtotal (companies with annual corporate fraud) | | | | |
| Less: Companies that cannot be found in SEC EDGAR database | 111 | | | |
| Less: Companies that cannot be found in Compustat database | | | | |
| Less: Companies that cannot be found in SeekingAlpha | 343 | | | |
| Less: Financial companies: Banks & Insurance (SIC 6000-6999) | 103 | | | |
| Less: Companies' financial data in fraud years cannot be found in Compustat database | 22 | | | |
| Less: Companies that are disclosed before the establishment of SeekingAlpha | | | | |
| Less: Companies that do not have enough social media data | 56 | | | |
| Total | 64 | | | |

Sample Selection

- Oversampling strategy (1:1 ratio for fraudulent and nonfraudulent firms):
- 1. find a direct match on the basis of the fraud year, size, and industry
- 2. each firm should also have enough textual data on SeekingAlpha
- 3. randomly chose if many firms meet the selection criteria
- Final data set includes 64 fraudulent firms together with a corresponding 64 matched nonfraudulent firms.

| Dataset (128 firms) | No. of Analysis reports | No. of Breaking news | No. of StockTalk messages | No. of sentences | No. of words | No. of financial ratios |
|-------------------------|-------------------------------|----------------------------|---------------------------------|-----------------------|--------------------------|-------------------------|
| Social media data | 3,981 (31.10) | 2,251 (17.59) | 1,672 (13.06) | 184,356 (1,440.28) | 2,613,362 (20,416.89) | _ |
| MD&A data | _ | _ | _ | 92,712 (724.31) | 902,940 (7,054.22) | _ |
| Financial ratios | _ | _ | _ | _ | _ | 84 |

Will be influenced by rumors in social media?

 Too many false rumors in SeekingAlpha can cause issues in data quality and lead to imprecise classification of fraudulent and nonfraudulent firms.

Other Generalizability Check

- We extend Dechow et al.'s study period to December 31, 2014, carefully examine the 127 new AAERs and finally found 13 of them fraudulent (7). The average accuracy, recall, F1 measure, and AUC of our model on this holdout sample are 71.43 percent, 57.14 percent, 66.67 percent, and 69.39 percent, respectively.
- We assemble a new data set from another social media platform, Yahoo Finance.

Conclusion

- This study used social media data from financial platforms and proposed a text analytic framework, rooted in the SFL theory, which aims to extract signals/cues from social media data to detect early signs of fraud.
- We not only demonstrate the efficacy of social media features for fraud detection but also verify that a social media-based method can supplement existing corporate fraud detection approaches.

想法

- 没有提及提取社交媒体数据的时间窗口
- 谣言对模型影响的检验是一种事后的检验,无法在事前进行评断
- SFL-Based Framework预测股票收益
